## **Matrix-Vector Multiplication**

We map the column of the vector onto each row of the matrix, multiplying each element and summing the result.

$$egin{bmatrix} a & b \ c & d \ e & f \end{bmatrix} * egin{bmatrix} x \ y \end{bmatrix} = egin{bmatrix} a*x+b*y \ c*x+d*y \ e*x+f*y \end{bmatrix}$$

The result is a **vector**. The number of **columns** of the matrix must equal the number of **rows** of the vector.

An  $m \times n$  matrix multiplied by an  $n \times 1$  vector results in an  $m \times 1$  vector.

Below is an example of a matrix-vector multiplication. Make sure you understand how the multiplication works. Feel free to try different matrix-vector multiplications.

```
% Initialize matrix A
A = [1, 2, 3; 4, 5, 6; 7, 8, 9]

% Initialize vector v
v = [1; 1; 1]

% Multiply A * v
Av = A * v
```
